Network programming is inherently complex and doing it with a low-level C-style

socket API makes it even more complex and error prone. Boost.Asio is an O-O C++ library that is, just like raw Sockets API, built around the concept of a socket. Roughly speaking, Boost.Asio wraps raw Sockets API and provides the developer with O-O interface to it.

Network programming. Even though Boost.Asio can process any kind of data asynchronously, it is mainly used for network programming. This is because

Boost.Asio supported network functions long before additional I/O objects were added. Network functions are a perfect use for asynchronous operations because the transmission of data over a network may take a long time, which means acknowledgments and errors may not be available as fast as the functions that send or receive data can execute.
