Modeling and analysis is important to ensure good system performance. We develop manufacturing system models for: Control – Supporting the selection of desired control rules. Performance prediction – Verifying potential plans and sensitivity. Optimization – Determining the best values for decision variables.

Modeling And Analysis Of Manufacturing

This model takes into account major variation factors, including part manufacturing error (PME), fixture position error (FPE), and relocation-induced error (RIE). With the help of a finite element method (FEM), a state space model (SSM) is established to represent the relationships between the sources of variation and the final assembly variation.
