of coke, coal, grains, etc., steel, aluminium, concrete or FRP tanks including elevated tanks for the storage of water, spherical tanks (pressure vessels) for the storage of high pressure liquefied gases, and under-ground tanks for the storage of water and oil.

Behaviour of Elevated Water Tank under Sloshing Effect - IJERT

Abstract. The paper presents the results of an analytical investigation of the seismic response of isolated elevated water tanks. A discrete three-degree-of-freedom model of the isolated structure is presented that includes the isolation system, tower structure, and sloshing fluid. Fluid-structure interaction is modeled using the mechanical analogy proposed by Housner.

Elevated water tanks consist of huge water mass at the top of a slender staging which are most critical consideration for the failure of the tank during earthquakes. Since, the elevated tanks are frequently used in seismic active regions also hence their seismic behavior has to be investigated in detail.

Keywords: Elevated Water tank; Finite Element Method, Response Spectrum, ANSYS, Modal Analysis, Sloshing Wave height of water. INTRODUCTION. Seismic safety of ground based and elevated liquid filled containers is of great concern because of potential economic loss that might be incurred due to structural failure of the liquid container as well as the potential environmental impact the spilling of the contained liquid might have to surrounding area.

Reinforced concrete (RC) elevated water tanks are critical structures that are expected to remain functional after severe earthquakes in order to serve the water system networks. Despite this significant role, the number of research studies which investigated the nonlinear seismic response of RC pedestals in elevated water tanks is very limited. In the current codes and standards, the seismic response factors are mainly based on engineering judgement.

Development of Rocking Isolation for Response Mitigation of Elevated Water Tanks under Seismic and Wind Hazards Elevated water tanks are categorized as strategic components of water supply systems in modern urban management. Past

earthquake events have revealed the high vulnerability of these structures.

Performance Based Assessment of Seismic Response Factor ...

The post evaluation study on the failure of elevated water tank shows that there are significant seismic deficiencies to critical elements, including steel columns, diagonal braces and horizontal struts. The frame support of elevated water tank should have an adequate strength to resist axial loads, moment and shear force due to lateral loads.

This factor permits a designer to use a linear elastic force based design while accounting for nonlinear behavior and deformation limits. In this paper orderly approach is deputed to determine the seismic response factor of elevated water tank having different soil flexibility. For nonlinear static pushover analysis finite element method is used.

A seismic analysis of such tanks must take into account considering the fluid-structure interaction and sub soil condition, which are highly responsible for the amplification of ground motion. In present paper time history analysis of elevated water tank is carried out for more realistic seismic analysis using finite element software SAP 2000 .

Elevated steel water pipelines may be subjected to transverse and vertical seismic forces, and should be designed to withstand these forces safely. A specific elevated steel water pipeline is studied using a linear computer program that incorporates the response spectrum approach for seismic analysis.

The overhead staged water tanks are susceptible for high lateral forces during earthquakes. Due to which, the failure of beam-columns joints, framing elements and toppling of tanks arise.

Seismic Analysis of RC Elevated Water Tanks

The presentation summarizes the project work done on "Seismic Analysis of Elevated Water Tank". Elevated water tanks are important structures that serve the function of supplying municipal water to the civil community. The stability of such structure is highly uncertain in the eve of earthquake.

Abstract—Water tank is considered to be one of the most important structures in earthquake event. Elevated water tank consists of staging and large mass concentrated at top of staging whereas ground supported tank rest on firm ground. Behavior of water tank on staging is crucial and needs to be evaluated.
