The differential equation $y'' + ay' + by = 0$ is a known differential equation called "second-order constant coefficient linear differential equation". Since the derivatives are only multiplied by a constant, the solution must be a function that remains almost the same under differentiation, and e^x is a prime example of such a function.

Series Solutions of Differential Equations - Calculus Volume 3

Solve differential equations online. Differential equation is called the equation which contains the unknown function and its derivatives of different orders: $F(x, y', y'', \dots, y^{(n)}) = 0$. The order of differential equation is called the order of its highest derivative. To solve differential equation, one need to find the unknown function $y(x)$, which converts this equation into correct identity.
