Topology and Geometry of Three-Dimensional Manifolds

Synopsis The main topics of this course are cornerstones of 3-dimensional topology. Due to Thurston's Geometrisation Conjecture (proven by Perelman), every compact 3-manifold can be cut along surfaces into pieces that admit geometric structures.

A must for anyone entering the field of three-dimensional topology and geometry. Most of it is about hyperbolic geometry, which is the biggest area of research in 3-d geometry and topology nowadays. Most of it is readable to undergraduates. Its target audience, though, is beginning graduate students in mathematics.

Thurston's geometrization conjecture states that certain three-dimensional topological spaces each have a unique geometric structure that can be associated with them. It is an analogue of the uniformization theorem for two-dimensional surfaces, which states that every simply-connected Riemann surface can be given one of three geometries (Euclidean, spherical, or hyperbolic).
